Exercise

Subsetting vectors

If we want to display only selected values from the object, R can help us do that easily.

For example, if we want to see the cost of the last 3 items in our food list, we would type:

```
cost[3:5]
```

Note here, that we could also type `cost[c(3,4,5)]` and get the same result. The `:` operator helps us condense the code and get consecutive values.

Instructions

100 XP

We will learn to subset using several special operators.

- Use the `[` and `:` operators to access the temperature of the first three cities in the list, which are already stored in `temp`.

Take Hint (-30 XP)

script.R

☽ Dark Mode

```r
1   # cost of the last 3 items in our food list:
2   cost[3:5]
3
4   # temperatures of the first three cities in the list:
5   temp[1:3]
```
