

## Exercise

## New Codes

We can actually perform the same operation as in the previous exercise using the function `which.min`. It basically tells us which is the minimum value.

## Instructions

100 XP

Write one line of code that gives the index of the lowest population entry. Use the `which.min` command.

[Take Hint \(-30 XP\)](#)

## script.R

```
1 # Find the index of the smallest value for variable total
2 which.min(murders$total)
3
4 # Find the index of the smallest value for population
5 which.min(murders$population)
```

Dark Mode

Run Code
