Exercise

select

With `dplyr` we can use `select` to show only certain columns. For example with this code we would only show the states and population sizes:

```
select(murders, state, population)
```

Instructions   100 XP

- Use `select` to show the state names and abbreviations in `murders`. Just show it, do not define a new object.

[ ] **Take Hint (-30 XP)**

script.R   ☽ **Dark Mode**

```
1   # Load dplyr
2   library(dplyr)
3
4   # Use select to only show state names and abbreviations from murders
5   select(murders,state,abb)
```
